

To whom it may concern

I support the allocation of frequencies in the 60 meter band for amateur radio operators.

Using near vertical incidence sky wave propagation (NVISP), I have provided communications from President Harding Rapids in the bottom of the Grand Canyon in Arizona to Scottsdale, AZ for an ailing professor of geology who was unable to ccompany his class on its required field trip through the Canyon.

Having 60 meters for such purposes would help assure that nearly 24 hour links would be possible in the future, which is not the case at present when limited to 80 and 40 meters.

Thank you for your consideration.

Charles R. Wallace W1OSV
